

Ordered Items: **QuantiFERON-TB Gold Plus; Drawing Fee**

Date Collected: 09/22/2021

Date Received: 09/22/2021

Date Reported: 09/25/2021

Fasting: Yes

QuantiFERON-TB Gold Plus

Test	Current Result and Flag	Previous Result and Date	Units	Reference Interval
QuantiFERON Incubation ⁰¹	Incubation performed.	Incubation performed.	10/07/2019	
QuantiFERON Criteria ⁰²	The QuantiFERON-TB Gold Plus result is determined by subtracting the Nil value from either TB antigen (Ag) tube. The mitogen tube serves as a control for the test.			
QuantiFERON TB1 Ag Value ⁰²	0.75	0.47	10/07/2019	IU/mL
QuantiFERON TB2 Ag Value ⁰²	0.61	0.65	10/07/2019	IU/mL
QuantiFERON Nil Value ⁰²	0.05	0.04	10/07/2019	IU/mL
QuantiFERON Mitogen Value ⁰²	>10.00	4.21	10/07/2019	IU/mL
▶ QuantiFERON-TB Gold Plus⁰²	Positive Abnormal	Positive	10/07/2019	Negative
	Chemiluminescence immunoassay methodology			

Disclaimer

The Previous Result is listed for the most recent test performed by Labcorp in the past 3 years where there is sufficient patient demographic data to match the result to the patient.

Important Information Regarding Your Test Results

Please review your test results carefully.

You should discuss your results with a **medical professional** to determine the appropriate follow-up.

See the section below which corresponds to your test for additional information.

If you have any questions, please call Request A Test at **1-888-732-2348**.

Lead Blood Testing

Lead blood levels may be elevated due to workplace exposure or contaminants in your residence or environment.

If your test results are flagged as Alert or Critical, speak to your doctor as soon as possible.

If your test results are higher than the normal reference interval:

- Remove the suspected source of exposure or limit your contact with the contaminated area.
- If you are testing due to lead exposure in the workplace, consult your employer and follow their guidelines for limiting your exposure.
- It is recommended that you retest periodically to ensure your levels are going down.

If your levels do not go down in subsequent testing or you are experiencing common **symptoms of lead poisoning** such as joint or muscle pain, anemia, tingling or numbness in the extremities, metallic taste in the mouth, headache, memory loss, elevated blood pressure, or mood disorders, consult your doctor.

Tuberculosis Testing

If your **Quantiferon** test results are **positive**:

- Positive Quantiferon test results may indicate the presence of Tuberculosis bacteria but cannot differentiate between latent and active TB infections.
- If you are not experiencing any symptoms or have no risk factors for TB, follow up with your doctor. Your doctor may recommend additional testing such as a chest x-ray or culture test to rule out active infection.
- If your testing was required by your employer, provide them with your results and discuss the appropriate follow-up.

Indeterminate Quantiferon results may require repeat testing or additional testing of a different methodology.

Varicella, Rubella, Rubeola IgM Antibody

Positive results may indicate that you have recently been exposed to a **viral infection**.

The period of time during which a person is **contagious** will vary. It may be necessary to stop attending work, school, or other activities and limit your exposure to other people. **Consult your doctor** to determine when it will be safe to be return to your regular activities.

You may need to notify other people with whom you have had recent close contact to inform them of your results so they can also be tested if needed.
